

Classification and Regression

- Decision Trees can be used for both

X1	X2	Y
0.268	0.266	Bad
0.219	0.372	Bad
0.517	0.573	Bad
0.269	0.908	Good
0.181	0.202	Bad
0.519	0.898	Good
0.563	0.945	Bad
0.179	0.661	Bad

Classification

- Spam / not Spam
- Admit to ICU /not
- Lend money / deny
- Intrusion detections

CART

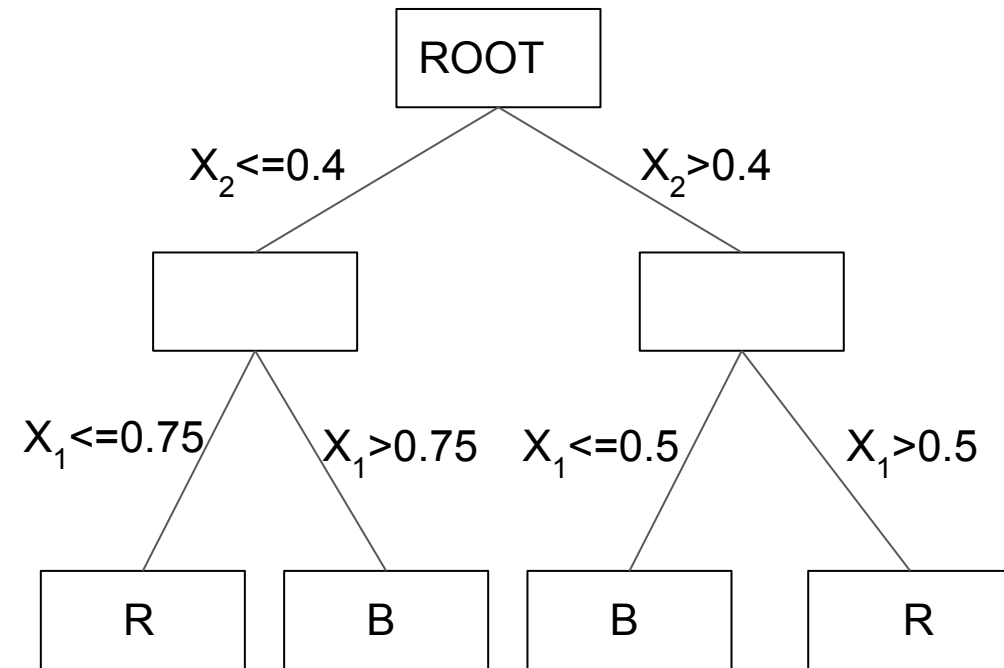

0.2 0.2 → ? → Bad

X1	X2	Y
0.268	0.266	64.41
0.219	0.372	28.08
0.517	0.573	95.76
0.269	0.908	15.84
0.181	0.202	41.83
0.519	0.898	25.20
0.563	0.945	9.44
0.179	0.661	82.77

Regression

- Predict stock returns
- Pricing a house or a car
- Weather predictions (temp, rain fall etc)
- Economic growth predictions
- Predicting sports scores

Visualizing Classification as a Tree

Metrics

- Algorithms for constructing decision trees usually work top-down, by choosing a variable at each step that best splits the set of items.
- Different algorithms use different metrics for measuring "best"
- These metrics measure how similar a region or a node is. They are said to measure the impurity of a region.
- Larger these impurity metrics the larger the "dissimilarity" of a nodes/regions data.
- Examples. Gini impurity, Entropy, Variance

This file is meant for personal use by bowen.wilder@gmail.com only.

Gini impurity

- Used by the CART
- { Is a measure of how often a randomly chosen element from the set would be incorrectly labeled if it was randomly labeled according to the distribution of labels in the subset.
- Can be computed by summing the probability of an item with label i being chosen (p_i), times the probability of a mistake ($1 - p_i$) in categorizing that item.
- Simplifying gives, the Gini impurity of a set:

$$1 - \sum_{i=1}^J p_i^2$$

$$\begin{array}{lcl}
 \begin{array}{c} \nearrow \\ \rightarrow \\ \searrow \end{array} & \begin{array}{c} P1 \\ P2 \\ P3 \end{array} & \begin{array}{l} P1(1-P1) = P1P2 + P1P3 \\ P2(1-P2) = P2P1 + P2P3 \\ P3(1-P3) = P3P1 + P3P2 \end{array}
 \end{array}$$

$$\sum P_i(1-P_i) = \sum P_i - \sum P_i^2 = 1 - \sum P_i^2$$

CART: An Example

Cust_ID	Gender	Occupation	Age	Target
1	M	Sal	22	1
2	M	Sal	22	0
3	M	Self-Emp	23	1
4	M	Self-Emp	23	0
5	M	Self-Emp	24	1
6	M	Self-Emp	24	0
7	F	Sal	25	1
8	F	Sal	25	0
9	F	Sal	26	0
10	F	Self-Emp	26	0

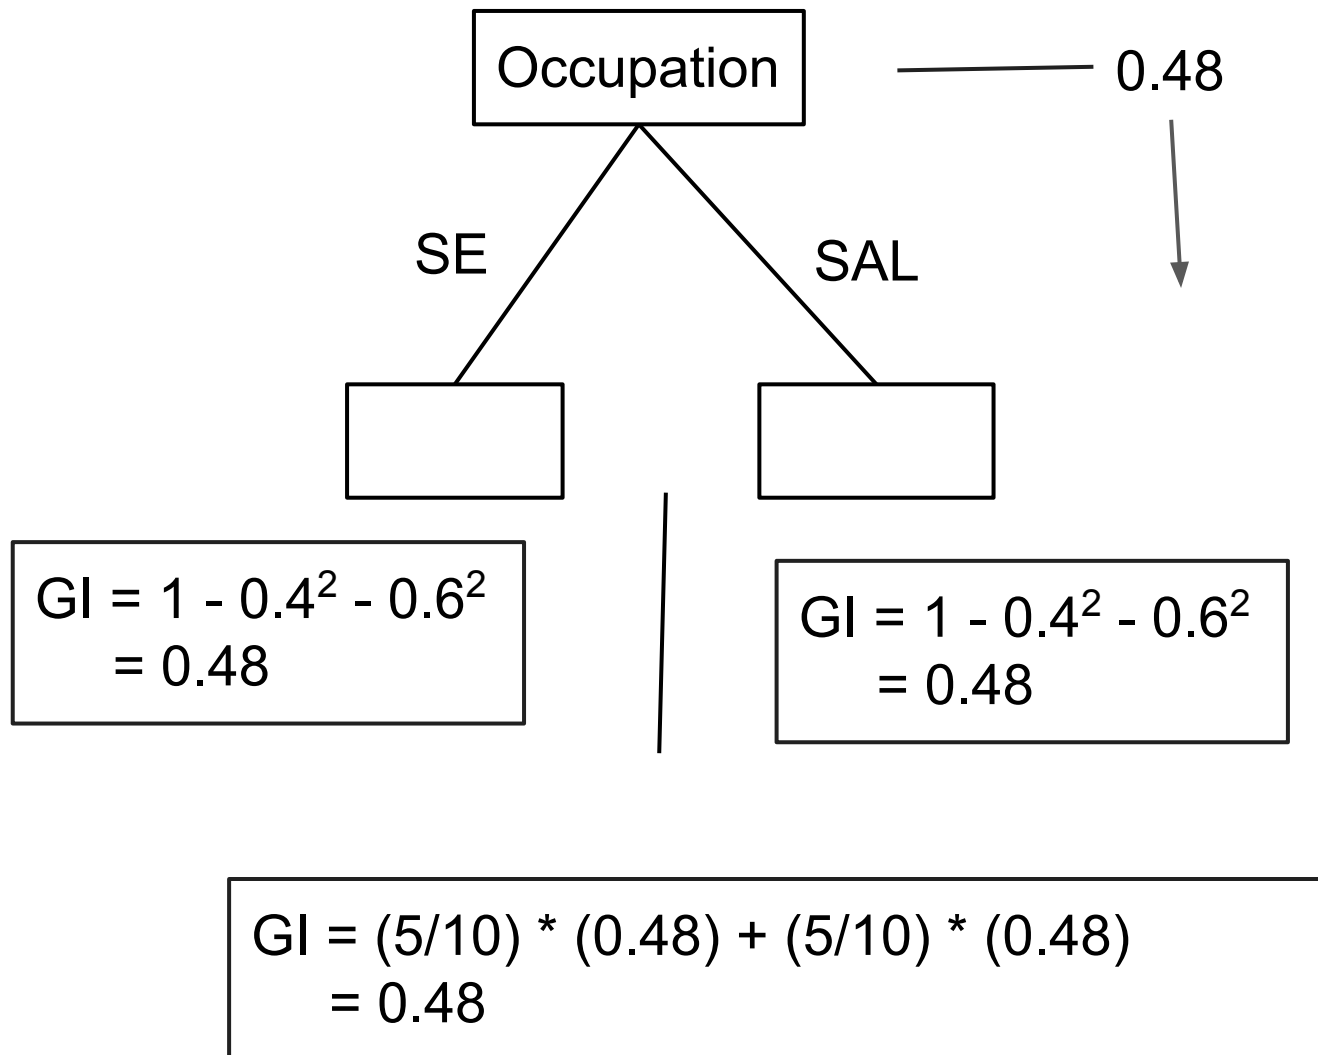

Root node : $P1 = 0.4$, $P2 = 0.6$
 $GI = 1 - (0.4)^2 - (0.6)^2$
 $= 0.48$

1. $P1 = 0.5$
 $P2 = 0.5$
 $1 - 0.5^2 - 0.5^2$
 $= 0.5$

2. $P1 = 0.25$
 $P2 = 0.75$
 $1 - 0.25^2 - 0.75^2$
 $= 0.375$

$$GI = (6/10) * (0.5) + (4/10) * (0.375) = 0.45$$

L	R	Left	Right	Gini Split
≤ 22	> 22	0.5	0.47	0.48
≤ 23	> 23	0.5	0.44	0.47
≤ 24	> 24	0.5	0.38	0.45
≤ 25	> 25	0.5	0	0.40

0.48

0.40

$$\text{Gini Gain} = 0.48 - 0.40 = 0.08$$
